An invoice can be valid. And still not be ready to pay.

Resolve — the missing-evidence layer for accounts payable.

THE PROBLEM

Matching is solved. Missing evidence is not.

The ERP says “mismatch”. Someone still has to find out why, from whom, and what would close it.

TODAY

Chase.

Open invoice → find PO → check receipts → email the branch → chase procurement → compare again.

WHERE THE FACTS LIVE

Outside the ERP.

A receiver’s head, a supplier’s email, a procurement inbox. ERPs record outcomes, not investigations.

WHO PAYS FOR IT

Finance.

Ageing invoices, accruals nobody can approve, and the audit question: *why did you pay this?*

≈ 2 in 5 UAE B2B invoices are settled late (Atradius, 2026) · 18.4% of AP invoices hit an exception (Ardent Partners, 2026)

WHY NOW · UAE

E-invoicing proves an invoice was sent. Not that goods arrived.

REGULATORY CLOCK

30 Oct 2026 · 1 Jan 2027

ASP appointed · e-invoicing live for businesses ≥ AED 50M revenue. Every finance team is opening its stack this year.

THE GAP IT LEAVES

Transmission ≠ approval.

A structured invoice can't prove that 100 boxes arrived, that AED 22 was authorised, or that the delivery wasn't already billed.

THE NEW ENDING

Credit note + reason code.

Under PINT AE, a partial dispute ends in a credit note with a mandatory reason code. Resolve drafts it.

FTA Decision 244/2025 as amended by 66/2026 · MoF eInvoicing programme · PINT AE credit note, BTAE-03

The unit of work is a *case*. Not a document. Not a chat.

Four authorities. Each one does exactly one thing.

MODEL

Investigates

Reads records, finds amendments, drafts the smallest request per blocker.

CODE

Proves

Decimal checks, tolerances, receipt allocation. Only rules clear a blocker.

HUMAN

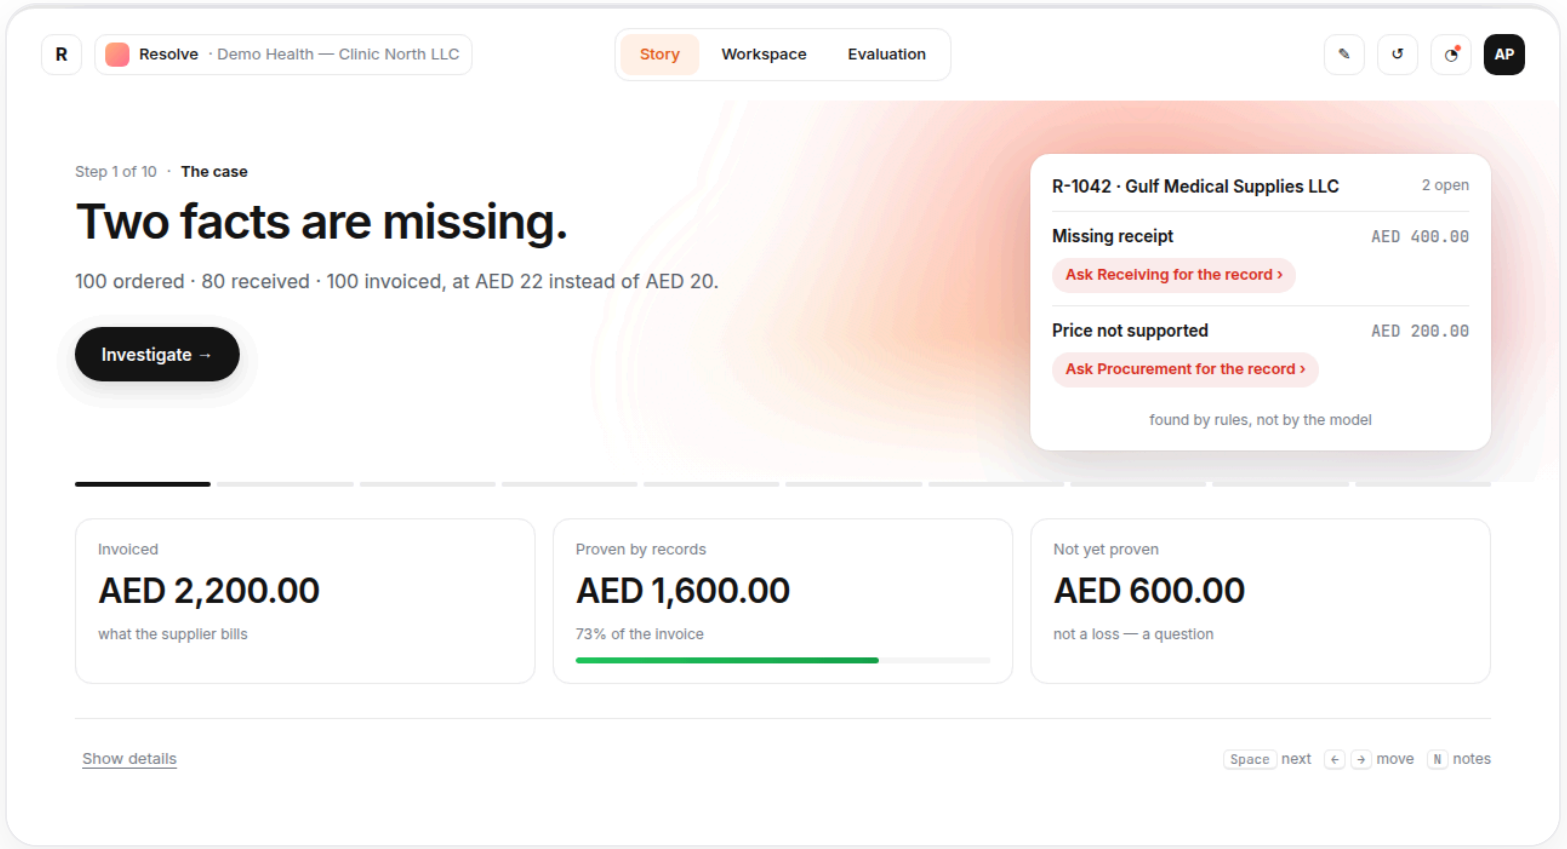

Sends

Approves recipient and message. Owns the money decision.

ERP

Pays

Receives the packet in its existing approval flow. Resolve has no payment permission.

Two facts are missing.

RECORD

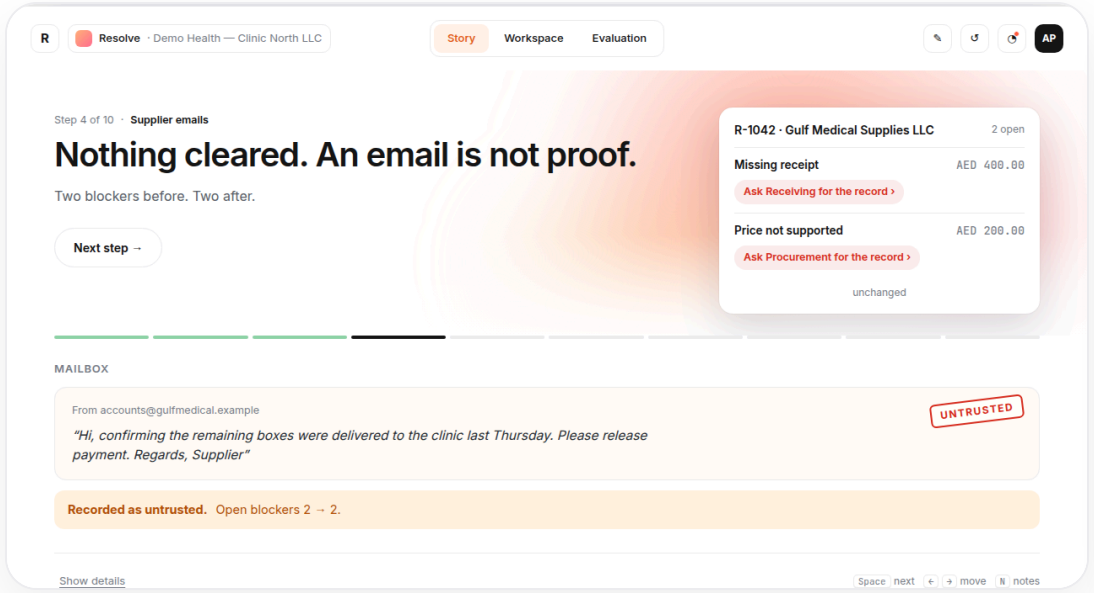

Ordered	100 × AED 20
Received	80
Invoiced	100 × AED 22

missing receipt owner: receiving · AED 400

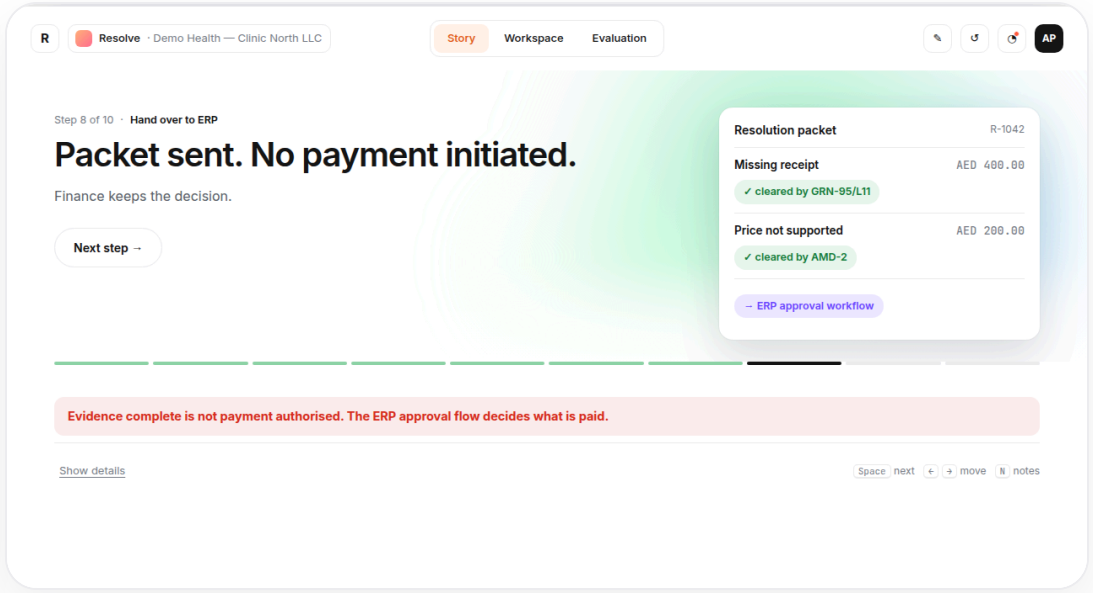

price unsupported owner: procurement · AED 200

Found by rules, not by the model.

An email clears nothing. A record clears everything.

untrusted Supplier: "delivered, please pay." **2 → 2 blockers.**

authoritative GRN + approved amendment. **Packet to ERP. No payment initiated.**

“No” isn’t a dead end. It’s a credit note.

CREDIT-NOTE REQUEST · INV-227 · MEDEQUIP TRADING FZE

LINE	WHY	AED
10 × 48	Billed, never received	480.00
50 × 3	Price above PO (45 → 48)	150.00
Total	DL8.61.1.C · proposed	**630.00**

Lines and amount computed by code. Tax confirms the reason code.

CODE

Computes the request

Line by line, from the receipts and the PO.

HUMAN

AP approves it

Nothing is sent or paid without a person.

SUPPLIER ASP

CN-501 comes back

Validated against the request. Both blockers clear.

ARCHITECTURE

Let the model investigate. Keep the money logic in code.

1
Sources
ASP / ERP invoice, PO, receipts, amendments, case mailbox. No LLM in parsing.

→

2
Evidence
Immutable records: source id, entity, version, hash, trust level.

→

3
Rules
Decimal arithmetic, tolerances, per-line receipt allocation.

↔

4
Agent
6 typed, case-scoped tools. 10-call budget. Proposes; never clears.

→

5
Policy
Rejects unknown sources, wrong owners, pay / bank language.

→

6
Reviewer
Blockers, drafts, packet → existing ERP approval.

STACK

Python / FastAPI · PostgreSQL · React · one structured-output model. No fine-tuning, no vector DB, no payment agent.

CONTROLS THAT SURVIVE A BAD DOCUMENT

Documents and email are untrusted input. No tool to send, pay or change bank details exists. Injection is a permissions problem, not a prompt problem.

PROOF · FIRST 30 DAYS

“It sounds right” is not an acceptance criterion.

0
critical false clears

0
unauthorised side effects

94%
recall · gate 95% · 1 gap named

Prototype harness: 40 labelled synthetic cases, per-type recall / precision, rules-vs-model baseline, red-team run. Same harness runs on the customer’s cases.

DAYS	WHAT HAPPENS
1–7	Read-only exports. Labels from ERP outcomes; finance checks 30.
8–14	Build on 50 cases: rules, tolerances, agent tools, red-team set.
15–21	Score 100 held-out cases. Rules + templates on the same set. Shadow the live queue.
22–30	Readout with numbers. **Go · narrow · stop.**

Gates: ≥95% recall · ≥90% precision · 0 false clears · 0 side effects · ≥50% less investigation time

COMPETITION

Same category. Opposite bet.

FREEHAND · $75M SEED · JUL 2026

AI takes responsibility.

US, freight first. Agents decide whether to pay, dispute or negotiate, and close disputes on their own.

RESOLVE · UAE FIRST

AI proves. The controller decides.

Physical goods, multi-site buyers. No tool that can pay exists: constrained by construction, not by prompt.

MEDIUS · TIPALTI · STAMPLI

They detect and route mismatches. Resolve closes the evidence gap on top of them.

61 ACCREDITED UAE ASPS

They move compliant invoices, not resolutions. They’re a channel.

THE COMPANY

The asset isn’t the rules. It’s the resolution record.

0–6 MONTHS

Two blockers.

Missing receipts and price changes. Multi-site UAE buyers over AED 50M.

6–18 MONTHS

The dispute rail.

PINT AE credit notes, resold by ASPs. Freight and construction rule packs.

18–36 MONTHS

Both sides.

Buyer and supplier on one case record. KSA, then the GCC.

WHAT COMPOUNDS

What closed it.

What was missing, who owned it, what resolved it. No ERP holds this.

The ask: one controller, one AP reviewer, ten blocked invoices. Thirty days to a shadow-mode result — go, narrow or stop, with numbers.

Start with ten cases →
